

If it's in the **stormwater**, it's in a BaySaver separator and filter.

From suspended solids, to greater than 80% of TSS (d_{50} of 23.2 microns) and more than 50% of total Phosphorous, our intuitively engineered line of BaySaver products efficiently remove major pollutants from even the largest storms and leave them behind.

Let BaySaver custom design our third party tested and verified BaySeparator, or the widely acclaimed BayFilter, with its incredible 30 gpm/cartridge flow rate, for your next stormwater project. Individually or applied in tandem in a BaySaver

treatment train, be assured that the products you choose will perform exactly as designed and prove more economical, and easier to specify, install, and maintain than any on the market today.

Find out more about the value built in to the entire line of BaySaver products. Go to baysaver.com to research, learn, specify, pick our brain, or just look around.
